

PRACTICAL ORE MINERALOGY

SPECTRUM 26

CONTENTS

PART 1

1. Introduction: what is a mineral anyway?	3
2. Rocks are made of minerals	5
3. Crystal structures	7
4. A brief overview of ore-forming processes	9
5. The importance of mineralogy for mineral process engineers	13
6. Mineral exploration techniques	15

PART 2

7. Basic mineral properties	19
8. Simple tools for mineral identification	25
9. More advanced tools for mineral identification	31
10. Density measurement	39
11. Blowpipe tests using a carbon block and fluxes	41
12. Microchemical techniques	43
13. Magnetic properties	45

PART 3

14. The importance of mineral associations	49
15. Gold minerals	53
16. Silver minerals	57
17. Iron ore minerals	59
18. Diamonds and diamond indicators	65
19. Heavy mineral sands	69
20. Copper minerals	81
21. Nickel sulfide and oxide ores	87

22. Nickel laterite ores	91
23. Cobalt minerals	93
24. Manganese minerals	95
25. Lead and zinc minerals	97
26. Tin, tungsten, tantalum and niobium deposits	103
27. Lithium minerals	107
28. Chromium and vanadium minerals	111
29. Rare earth minerals	113
30. Uranium and thorium minerals	115
31. Platinum group minerals	119
32. Borates	121
33. Garnet group minerals	125
34. Gemstones and semi-precious minerals	127
35. Phosphate minerals	131
36. Bauxite ore minerals	133
37. Micas	135
38. Clay minerals	137
39. Evaporite minerals	139
40. Feldspar minerals	143
41. Other commercial minerals	145
42. Other carbonate minerals	149
PART 4	
Mineral densities	155
Glossary	161
Index	165
